Questions

*

Do you find any issues with the query below:

"SELECT * FROM table WHERE city = $_POST['city']"

If so, which are they?

string " there should be .$_POST['city']. , better with string concatenation or $_POST to be put within its own variable.

*

Do you find any issues with the statement below:

if(!strpos($PHP, $P) ...

If so, how to correct it?

; is missing in the end

*

Given this code:

```
function foo( &$arg )
{
$z = $arg;
$arg += 1;
return $z;
}

$x = 3;
$y = foo( $x );
```

What will be the value of $x and $y after the function call and importantly why?

x = 4, y = 4 ,
the value of x will be change because of the References calling ,and return z which is also 4 will be assign to y .

*

Given this code:

```
$x = 2;
function doSomething()
{
$x = 3;
}
doSomething();
echo $x;
```

What will be the output and importantly why?

2 , inside the definition only works inside the doSomething . (globe and local scope) .

*

What will be the value of $x and importantly why?

```
$y = 012;
$x = $y/ 2;
```

5 , int / int always gives int , we have to add . or add . (point)

*

Given the example code below:

```
$a = "foo";
function foo(){ echo "hey"; }
$a();
```

Would the above throw an error when executed or what will be the output
and why?

the output its
hey
honestly tried to call a variable as a function in php ,but i tested this one as it is . for what i
know . it calls the closest function stored in the code
